

# Project Design Phase-II

## Data Flow Diagram & User Stories

### 1. Data Flow Diagram (DFD)

The DFD represents how a network request moves through the Automated Network Request Management system in ServiceNow—from submission by the requester to approval, record creation, fulfillment, notification, and closure.

#### DFD Flow

### Medical Project – Data Flow / Workflow

Patient → Submit Diagnostic Test Request → Validate Test Details → Create Diagnostic Test Record → Process Test → Update Lab Report → Send Notifications & Close Request

The main data stores represented are:

- D1 – Medical Service Catalog:** Stores diagnostic test catalog items and request variables.
- D2 – Diagnostic Test Request:** Stores submitted patient and test-request information.

- **D3 – Diagnostic Test Records:** Stores test-related records, assignments, and processing details.
- **D4 – Notification Log:** Records notification information sent to patients and medical staff.

The workflow includes **request validation, approval/processing handling, test assignment, result updates, and notifications**. This reflects the project's ServiceNow implementation using **Get Catalog Variables, Create Record, Ask for Approval, Flow Logic, Send Email, and Update Record**.

---

## 1. User Stories

| User Story ID | User Story                                                                                                                                                                      | Priority |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| US01          | <b>As a patient</b> , I want to request a diagnostic test through the medical service portal so that I can easily access the required medical testing service.                  | High     |
| US02          | <b>As a patient</b> , I want to provide all required patient and test details through a structured form so that my request can be processed correctly.                          | High     |
| US03          | <b>As a system</b> , I want to validate the diagnostic test request and route it for processing/approval so that only valid requests are handled.                               | High     |
| US04          | <b>As a medical staff member</b> , I want to review and approve diagnostic test requests so that authorized tests can proceed.                                                  | High     |
| US05          | <b>As a system</b> , I want to automatically create diagnostic test records/tasks after approval so that laboratory staff can begin processing without unnecessary manual work. | Medium   |
| US06          | <b>As a laboratory technician</b> , I want to view assigned diagnostic test tasks and update their progress so that tests can be completed efficiently.                         | High     |
| US07          | <b>As a patient</b> , I want to track the status of my diagnostic test request so that I know whether it is submitted, in progress, completed, or closed.                       | High     |
| US08          | <b>As a system</b> , I want to send notifications at important stages so that patients and medical staff remain informed about test progress and results.                       | Medium   |
| US09          | <b>As a medical administrator</b> , I want to view reports and analytics so that I can monitor test requests, processing time, workload, and service performance.               | Medium   |

## 2. Design Goal

The overall design aims to provide a **seamless, transparent, and automated experience for requesting, approving, processing, and tracking diagnostic tests**. The system reduces repetitive manual work for medical and laboratory staff while allowing patients to

**submit requests, track test progress, and receive timely notifications about their diagnostic services and reports.**
